Line Following Robot: Tutorial

In this tutorial we aim at extending the functionality of **BubbleRob** to let it follow a line on the ground.

Make sure you have fully read and understood the [first BubbleRob tutorial](#).

STEP 1

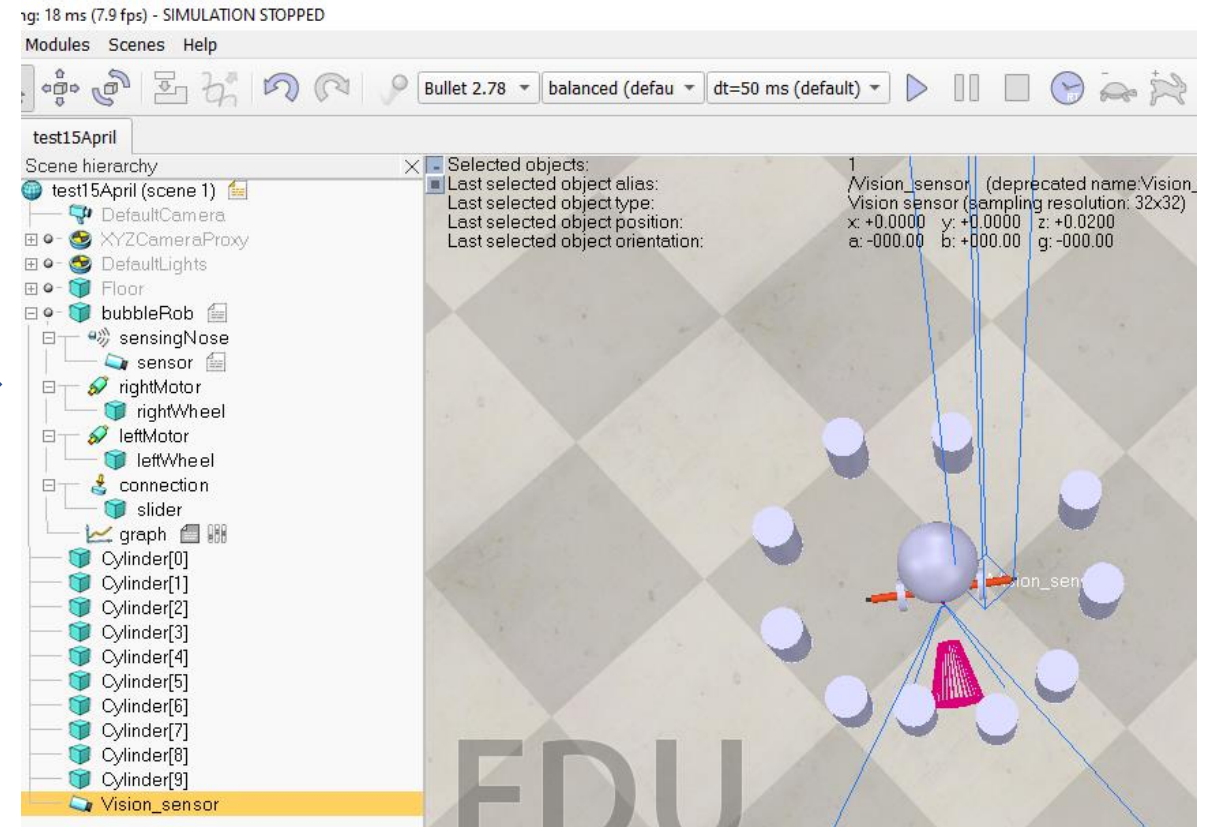

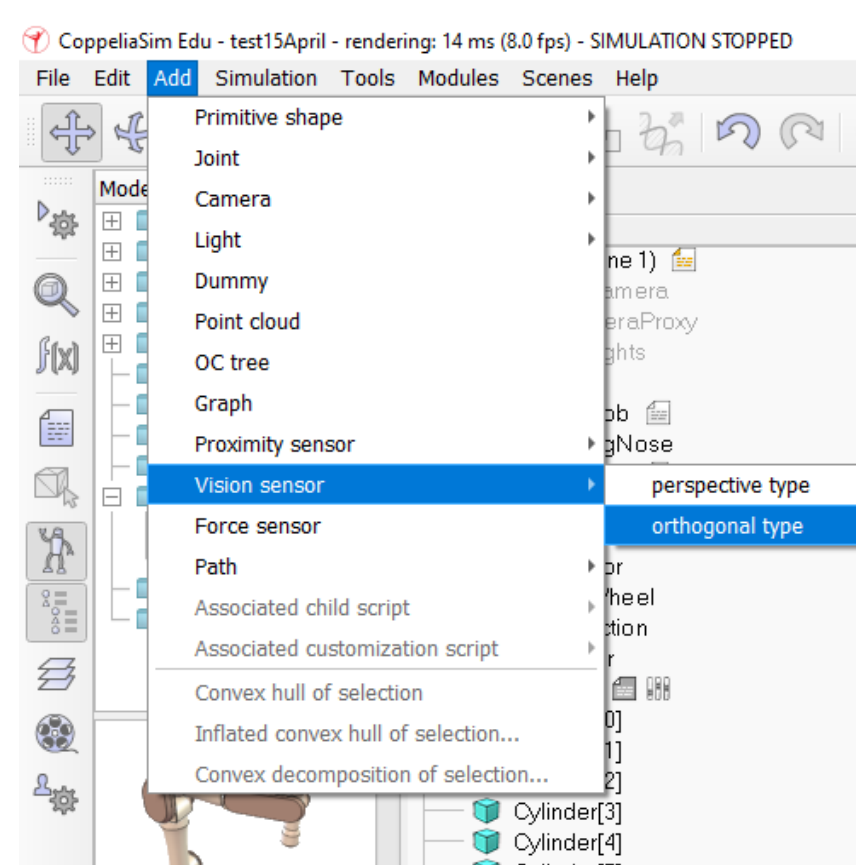

Load the scene of the first BubbleRob tutorial located in **scenes/tutorials/BubbleRob**.

STEP 2

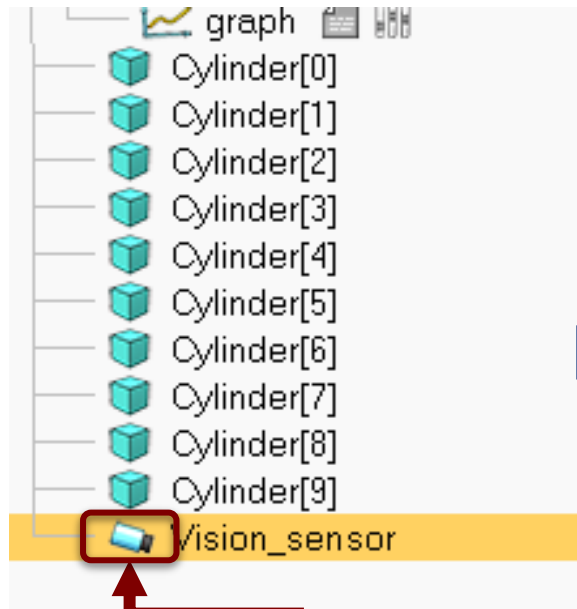

We first create the first of 3 vision sensors that we will attach to the bubbleRob object

[Menu bar --> Add --> Vision sensor --> Orthographic type]

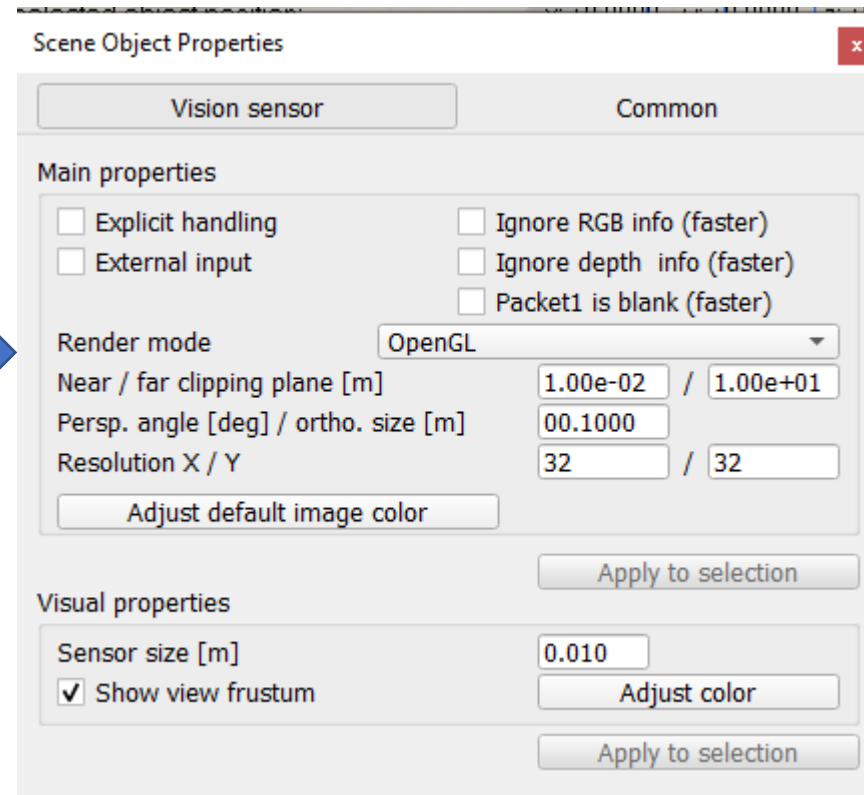

STEP 3

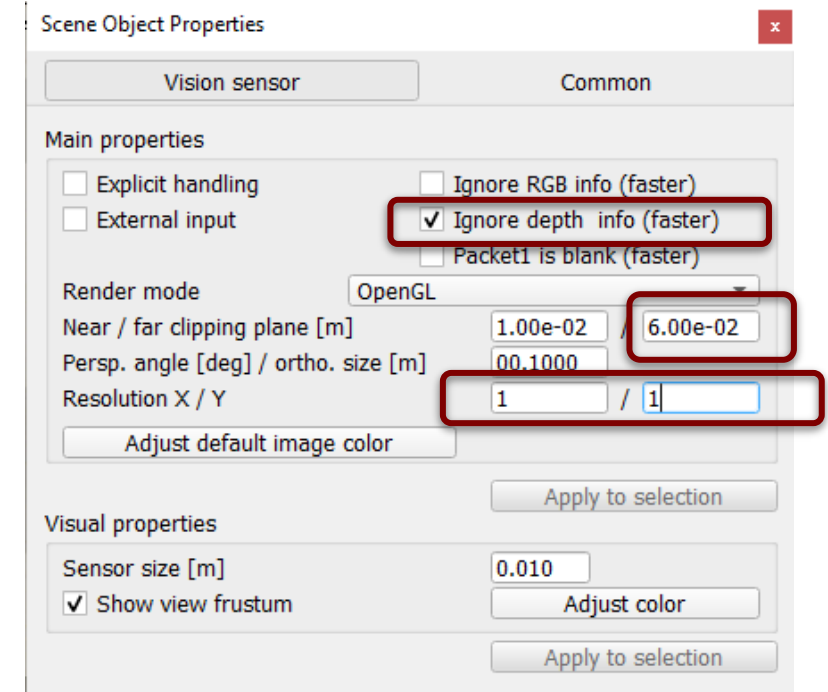

Edit its properties, by double-clicking on the newly created vision sensor icon in the scene hierarchy, and change the parameters to reflect following dialog:

Double Click
on camera
shape

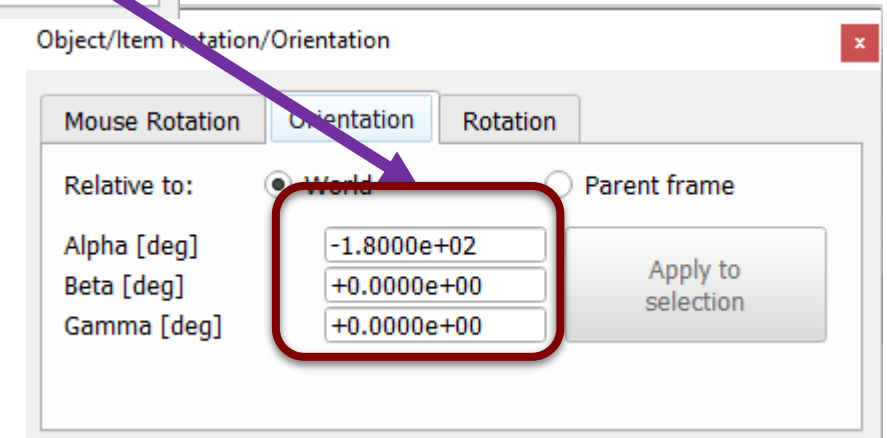

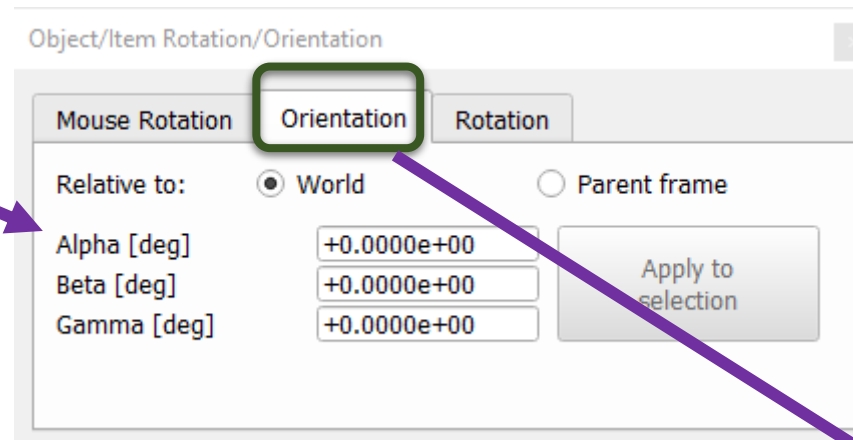

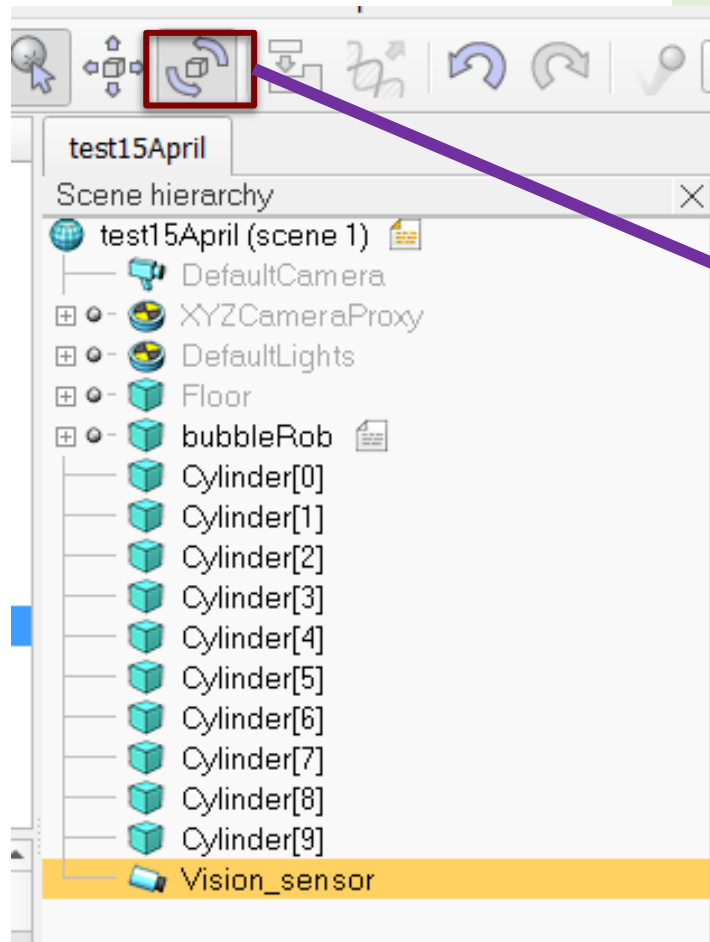

We adjust the far clipping to **6.00e-02** and **resolution 1/1**

STEP 4

The vision sensor has to be **facing the ground**, so select it, and in the **orientation dialog**, on the orientation tab, **Set [180;0;0] for the Alpha-Beta-Gamma items.**

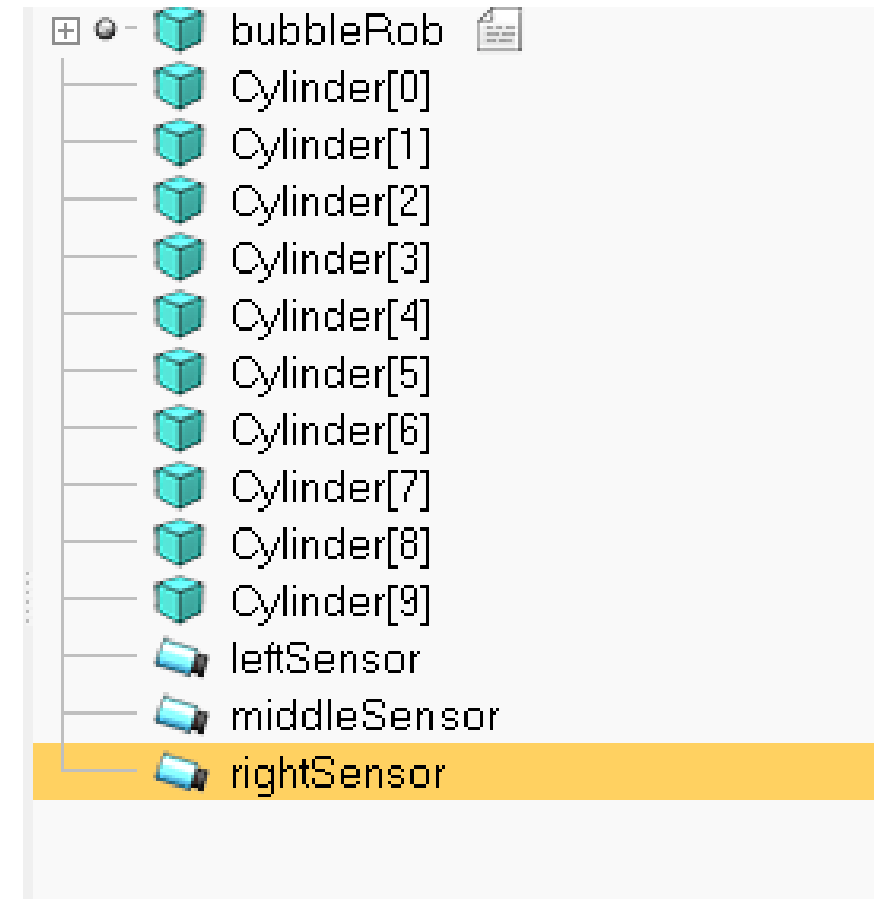

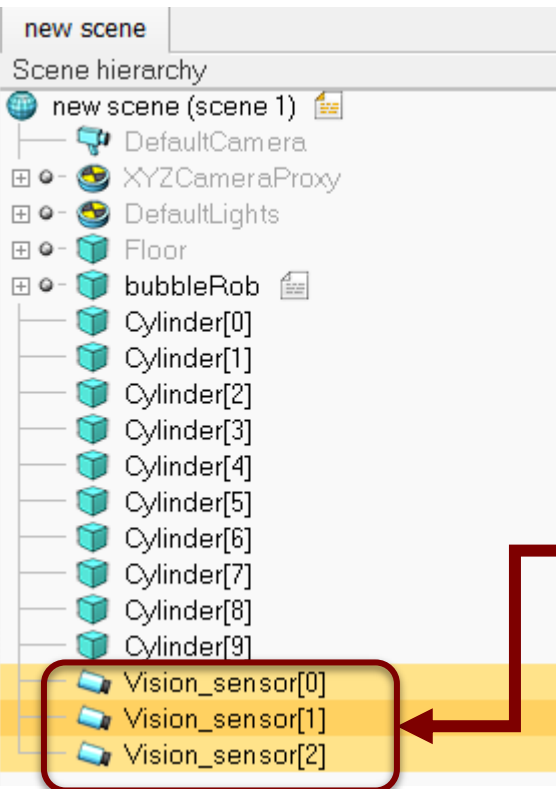

STEP 5

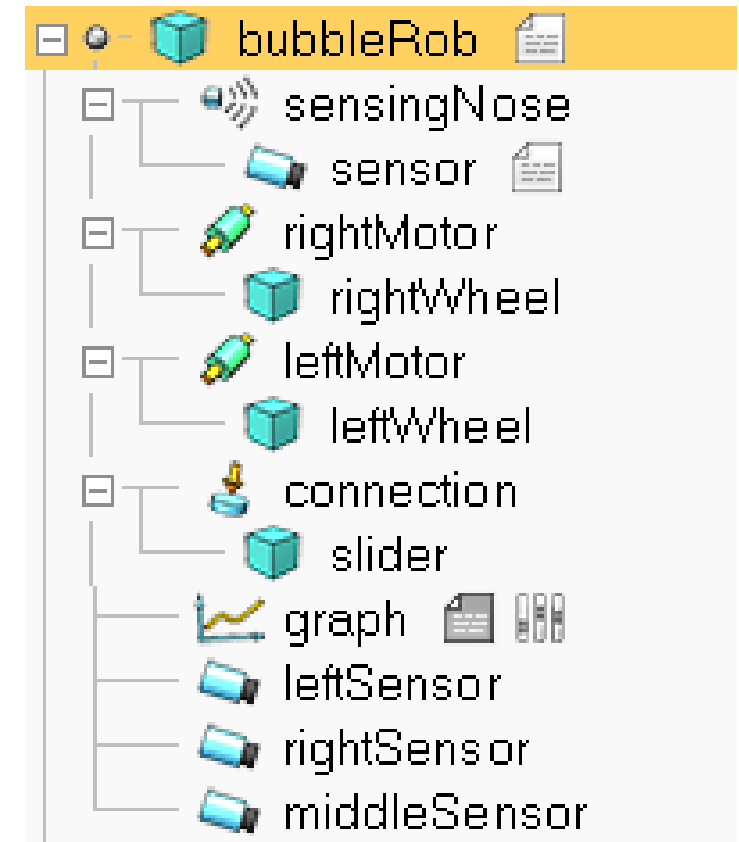

Now copy and paste the vision sensor twice, and adjust its aliases to.

Rename the **Vision_Sensor** as **leftSensor**, **middleSensor** and **rightSensor**

**Double Click on this
and rename it to
leftSensor,
middleSensor and
rightSensor
and
Press ENTER**

Now let's modify the environment. We can remove a few cylinders in front of BubbleRob. You can see the three sensors. Also make **bubbleRob** their **parent** (i.e. attach them to the bubbleRob object).

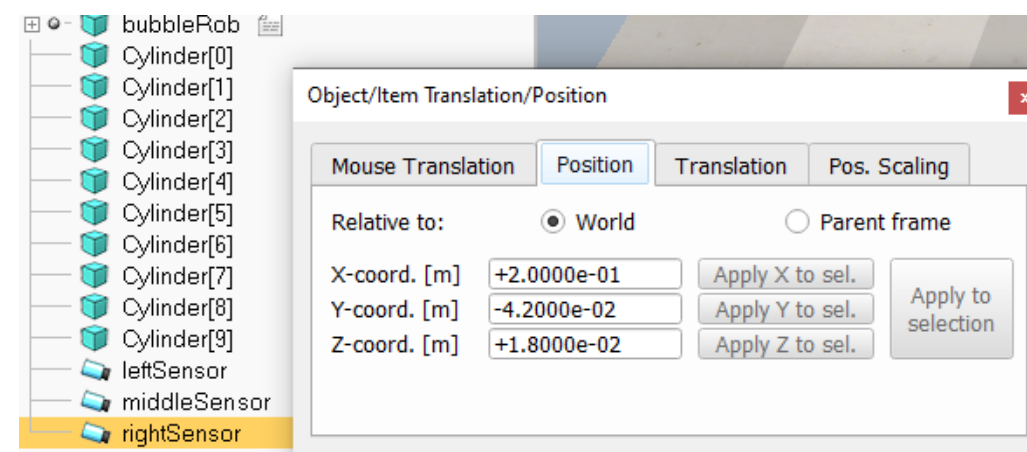

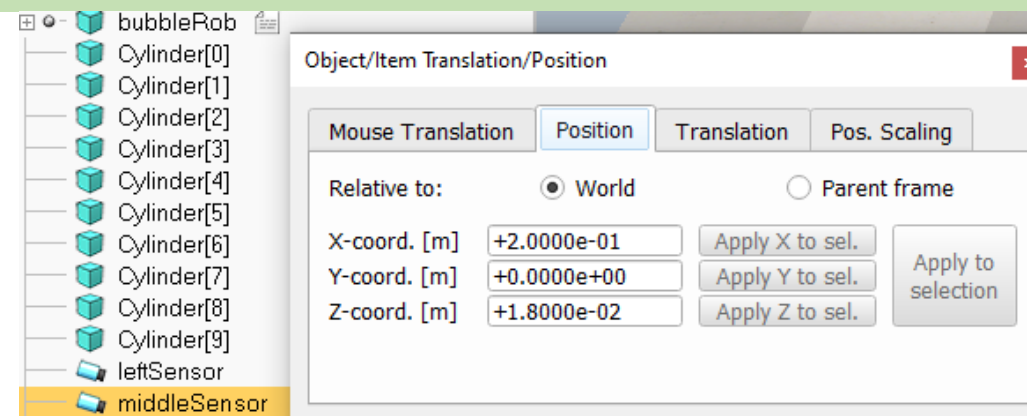

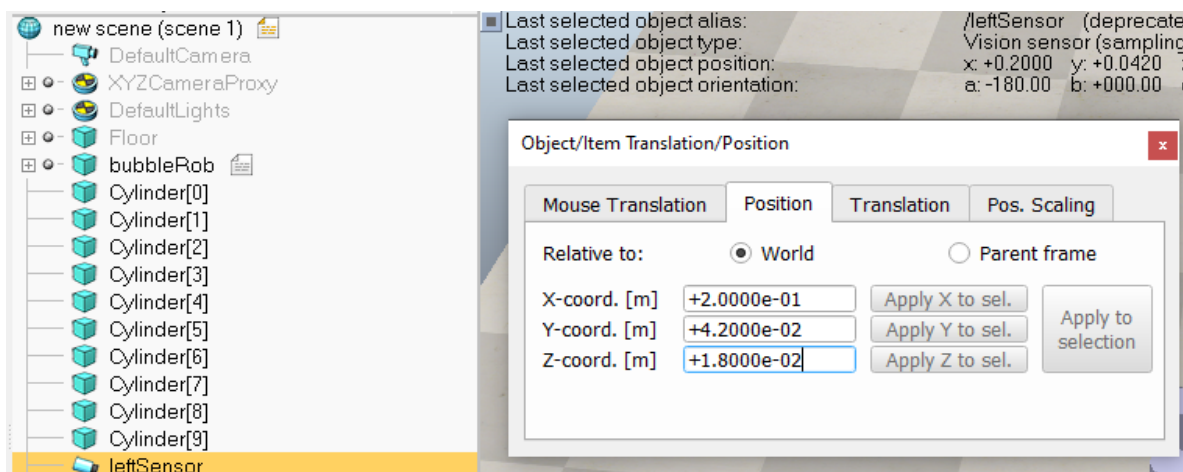

STEP 6

Let's **position the sensors correctly.**

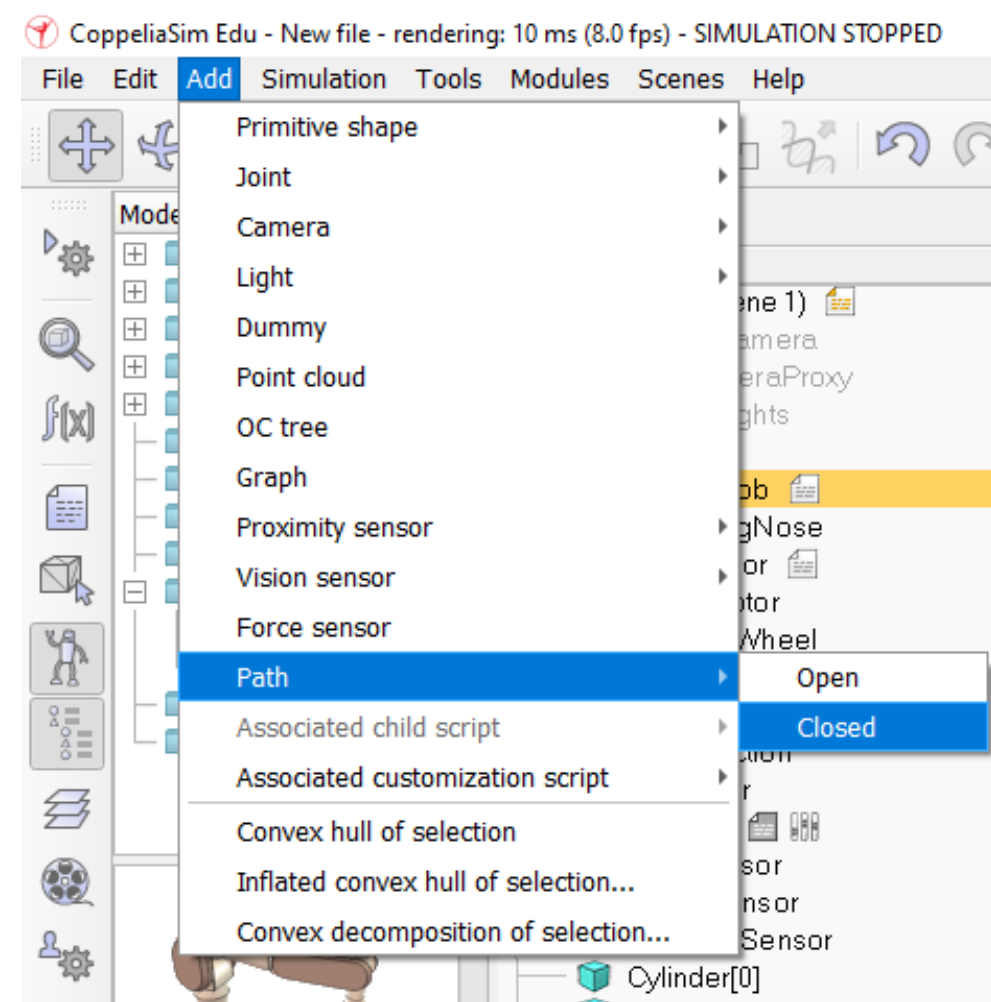

For that use the position dialog, on the position tab, and set following absolute coordinates:

left sensor: [0.2;0.042;0.018], **middle sensor:** [0.2;0;0.018], **right sensor:** [0.2;-0.042;0.018]

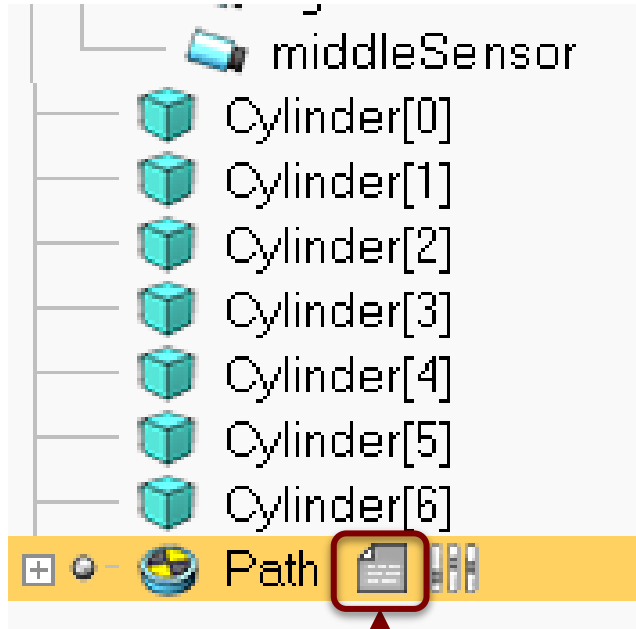

STEP 7

Build the path that the robot will try to follow: click [Menu bar --> Add --> Path --> Closed].

STEP 8

Open the **customization script** attached to it and replace its content and restart the customization script for the changes to take effect.

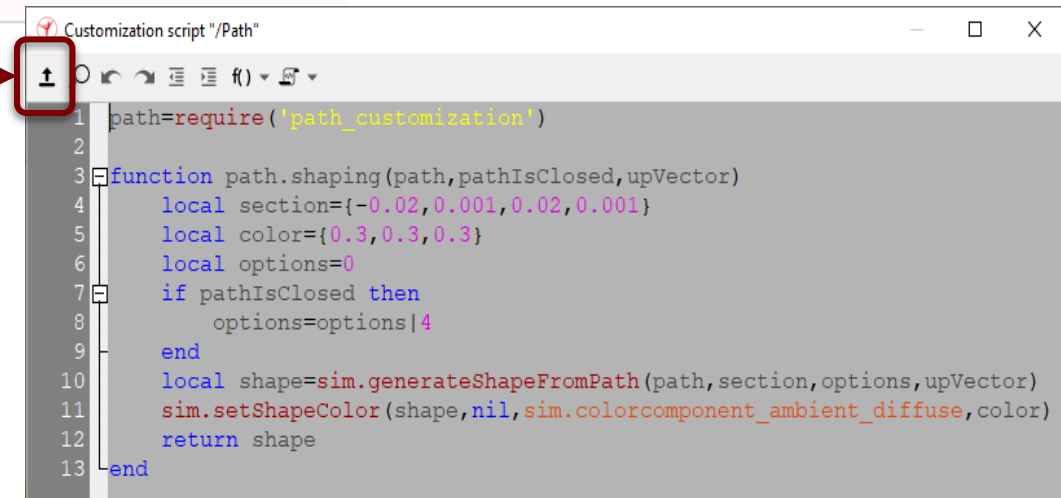

Double click on this and copy the code

```
path=require('path_customization')

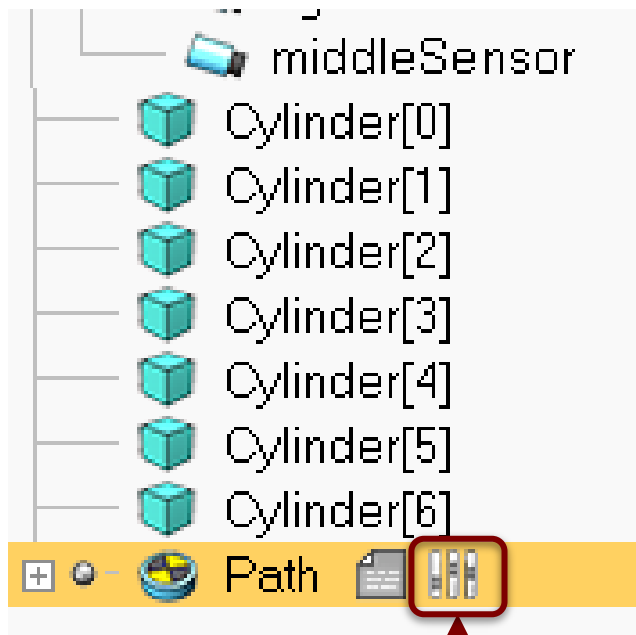

function path.shaping(path,pathIsClosed,upVector)
    local section={-0.02,0.001,0.02,0.001}
    local color={0.3,0.3,0.3}
    local options=0
    if pathIsClosed then
        options=options|4
    end
    local shape=sim.generateShapeFromPath(path,section,options,upVector)
    sim.setShapeColor(shape,nil,sim.colorcomponent_ambient_diffuse,color)
    return shape
end
```

Restart Script

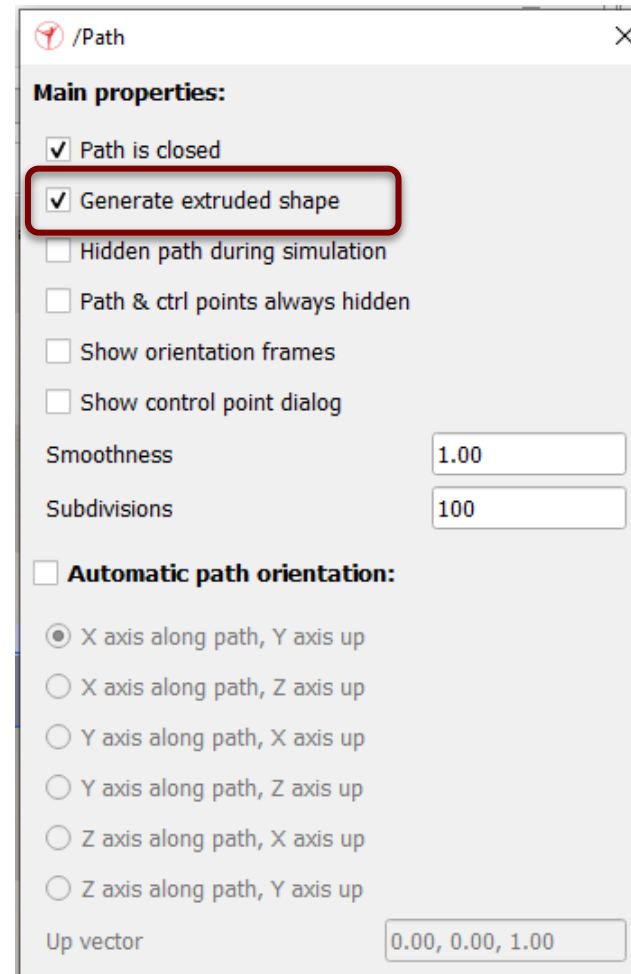

STEP 9

Open the path's user configuration dialog and check the Generate extruded shape checkbox.

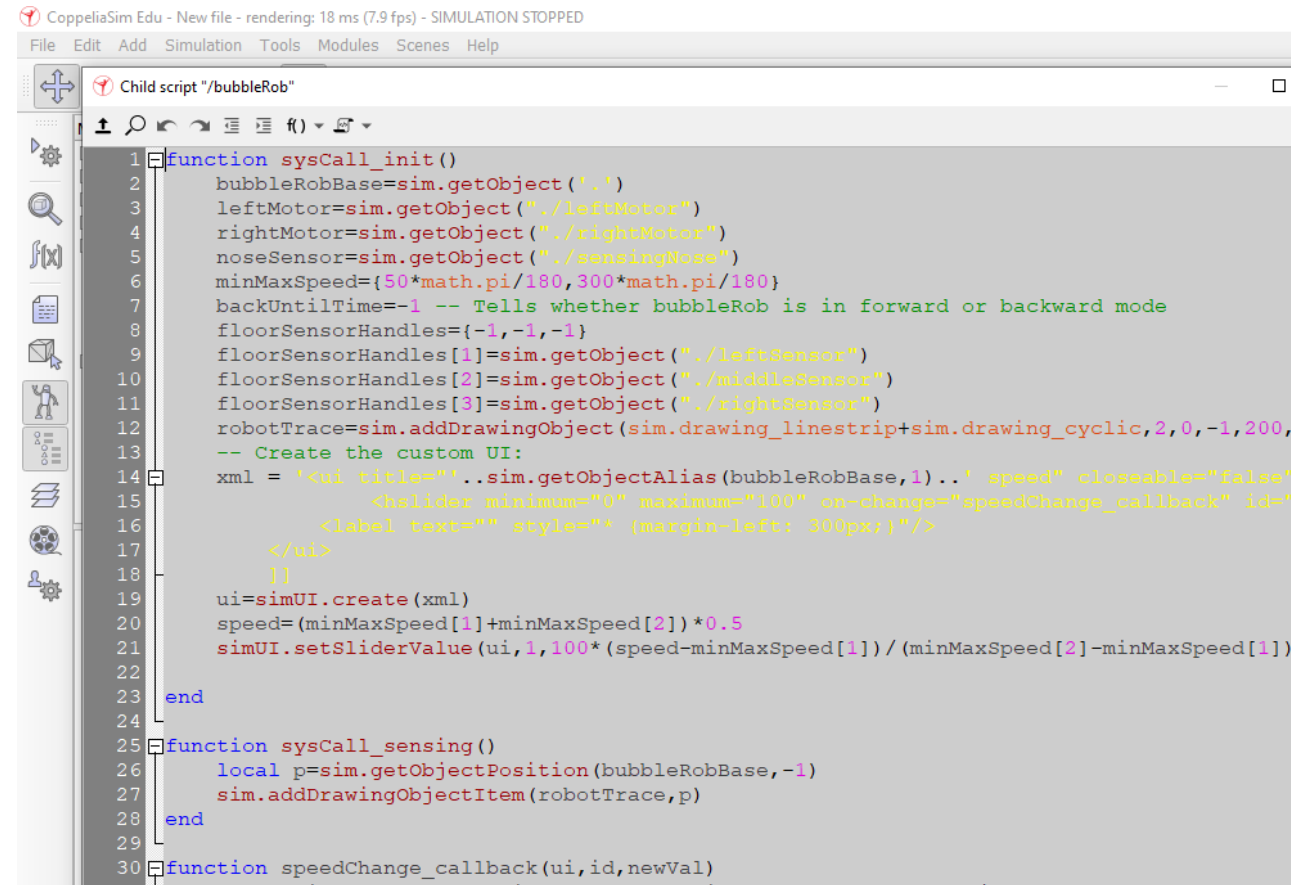

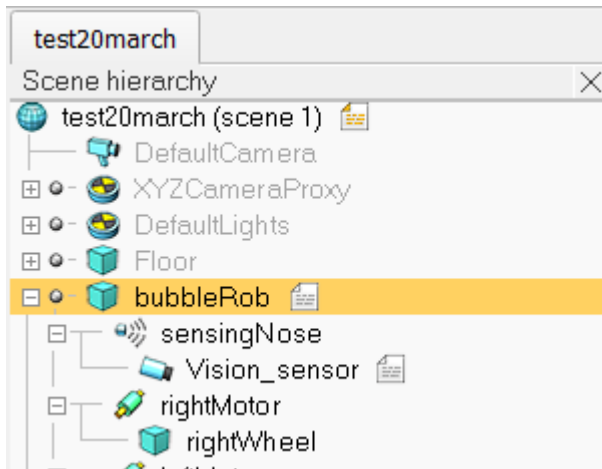

Double click on this

Adding child script: **Control BubbleRob's behavior**

STEP 10

Double-click the icon that appeared next to the vision sensor in the scene hierarchy: this opens the child script that we just added. We copy and paste following code into the script editor, then close it:

```
1 function speedChange_callback(ui,id,newVal)
2     speed=minMaxSpeed[1]+(minMaxSpeed[2]-minMaxSpeed[1])*newVal/100
3 end
4
5 function sysCall_init()
6     -- This is executed exactly once, the first time this script is executed
7     bubbleRobBase=sim.getObject('.') -- this is bubbleRob's handle
8     leftMotor=sim.getObject("./leftMotor") -- Handle of the left motor
9     rightMotor=sim.getObject("./rightMotor") -- Handle of the right motor
10    noseSensor=sim.getObject("./sensingNose") -- Handle of the proximity sensor
11    minMaxSpeed={50*math.pi/180,300*math.pi/180} -- Min and max speeds for each motor
12    backUntilTime=-1 -- Tells whether bubbleRob is in forward or backward mode
13    robotCollection=sim.createCollection(0)
14    sim.addItemToCollection(robotCollection,sim.handle_tree,bubbleRobBase,0)
15    distanceSegment=sim.addDrawingObject(sim.drawing_lines,4,0,-1,1,{0,1,0})
16    robotTrace=sim.addDrawingObject(sim.drawing_linestrip+sim.drawing_cyclic,2,0,-1,200,{1,1
17    graph=sim.getObject('./graph')
18    distStream=sim.addGraphStream(graph,'bubbleRob clearance','m',0,{1,0,0})
19    -- Create the custom UI:
20    xml = '<ui title=""..sim.getObjectAlias(bubbleRobBase,1).. speed" closeable="false"
21          <hslider minimum="0" maximum="100" onchange="speedChange_callback" id="1"/>
22          <label text="" style="* {margin-left: 300px;}"/>
23          </ui>
24    ]]
25    ui=simUI.create(xml)
26    speed=(minMaxSpeed[1]+minMaxSpeed[2])*0.5
27    simUI.setSliderValue(ui,1,100*(speed-minMaxSpeed[1])/(minMaxSpeed[2]-minMaxSpeed[1]))
```
